

ColourTone Masterbatch

Market leaders in colour masterbatch manufacture

We produce:

- universal masterbatches and polymer specific masterbatches for commodity plastics and particularly engineering polymers
- custom additive blends

Custom formulations - 'off the shelf' service

At Colour Tone we develop and produce custom masterbatch blends in less time than it takes to source a standard product.

We believe that 'standard colours' are a misnomer. Using our knowledge and experience, plus the latest colour matching, blending and compounding equipment, we have the technology to produce exactly what you want and in a time-scale to suit your production requirements.

We focus on delivering a responsive, high quality service for bespoke colours, in universal, commodity and engineering polymers, as well as custom additive blends.

ColourTone Masterbatch is one of the fastest growing specialist masterbatch manufacturers in the UK. Set up in July 1996 we are a highly successful independent business in a market dominated by multinationals.

We focus on delivering a responsive, high quality service for bespoke colours, in universal, commodity and engineering polymers, as well as custom additive blends.

We deliver custom colours to an exact match in less time than it takes to get a standard off-the-shelf universal product because we maintain production flexibility and this enables us to move quickly as demands change.

Our masterbatch materials are suitable for use in most plastics processes including injection and blow moulding, profile and sheet extrusion as well as fibres. As such they add market presence and competitive edge through unique, vibrant colours, physical properties and processing benefits that contribute to the performance of many products.

Over the last three years we have invested over £1.5 million in new plant, expanded our laboratory facilities to support growing demand for our colour matching and sampling service as well as allow us to press ahead with new products and processing development plans.
